Infrastructure and Network Security Statement

Company	Raízes Soluções e Tecnologia Ltda (CNPJ 51.467.037/0001-65)
Version	1.0
Effective date	03 November 2026
Next review	03 November 2027
Owner	Security and Privacy Officer, contato@raizesolucoes.com.br
Approved by	Management of Raízes Soluções e Tecnologia Ltda

1. Hosting model

Raízes production services run on managed cloud providers only: Supabase (database, authentication, storage and server functions) on AWS regions us-east-1 and us-east-2; Vercel (public website); GitHub (source code); Google Workspace (email and documents). We do not operate on-premise servers, and no production service runs on an office network.

2. Network segregation

- Network isolation, virtual private networking and firewalling are provided and monitored by our cloud providers.
- Production, staging and local development use separate projects and separate credentials.
- Direct database access requires credentials and is limited to authorized engineers.
- Public application endpoints are served over HTTPS only. The provider accepts TLS 1.2 and 1.3 on its HTTP APIs, and the database server is configured with TLS 1.2 as the minimum protocol version. Database connections are required to use TLS (SSL enforcement enabled in the provider settings).

3. Customer isolation

Each customer organization is logically isolated from the others by row-level security enforced inside the database. Tables that hold integration credentials have no access for browsers or end users, only for the server role.

4. Threat prevention and monitoring

- Provider-level protection against denial-of-service attacks and platform monitoring.
- Application level: mandatory authentication, validation of inputs and of OAuth state parameters, role-based authorization.
- Security-relevant events are logged; audit logs are kept for 12 months and reviewed when an alert or suspicion exists.

5. Secrets

Secrets are kept in the providers' secret stores or server environment variables. They are not stored in source code, are never sent to browsers or logs, and are rotated immediately when exposure is suspected.

6. Backups and availability

Database backups are taken daily and kept for 7 days by the provider. Recovery objectives (RTO and RPO of 24 hours) and the recovery procedures are defined in the Business Impact Assessment and in the Business

Continuity and Disaster Recovery Plan. A restoration test is performed at least once a year.

7. Responsibility and review

The Security and Privacy Officer (contato@raizesolucoes.com.br) owns this statement and reviews it at least once a year.
